

a Hypothetical irrigation conversion (744-cell sensitivity)

— Central irrigation: joint 95% interval
 ■ Irrigation + sampling scenario envelope

b Model diagnostic (744-cell sensitivity)

Outside 2-5 km: n=6; estimate withheld.
 Outside support: 14/744 matched cells.

● Measured: outside
 ● Measured: built-up
 × Model B: all matched cells
 ■ Model B: support passed (subset)
 □ Model B: support failed (subset)
 ● Measured: same subset as square (setting colour)

Shared irrigation depth makes panel a an algebraic re-expression of cooling per greened area, not an independent resource ranking.

Concurrent-change contrasts. Outside crosses are mostly unsupported; subset markers with n<10 are omitted; squares are not accuracy passes.
